

## 1. Introduction

I would like to make a site that will become a source of affordable and good books.

It will look like a structured catalog in which there are links with pictures and description of the books. Links from this catalog reference to known retailers that have given away books for free. Author information.

The site that refers to the recognized books or books of new authors who want to advertise themselves. The site on which the user can find a book from the category he wants and can search for book he wants.

There are many good books that you can get for free. And it will allow you to gain new knowledge.

This site can have mobile application that reference the same database. Mobile application can inform user about new books that are available.

## 2. Expected List of Features

There is list of categories. There is rating for each book. There is author information for each book.

Admin user can post new links to books with pictures and description.

Admin user can post author information. Admin user can delete old links.

Admin user can edit book information.

Ordinary users can post comments to the books they want. Also ordinary users can rate book.

There can be a script that fills the database from Amazon Api for example.

## 3. Market Survey

There are a lot of web sites with free books and links to free books.

Many sites do not have review system and have not very comfortable categories list or limited description.

Only few sites have author information.

## 4. References

<http://manybooks.net/> - excellent site but without rating system.

<http://www.freebooks.com/> - nice site but there is no user reviews, comments and rating.

<http://bookboon.com/> - it is not so simple to get information and links about book. User need to register to get any information.

<http://www.freebookshub.com/> - good site but there is no rating system for books. There is no description for the books.

<https://www.freebooksy.com/> - nice site but there is no user reviews, comments and rating.
